

INSTINCT ENGINE

Managing digital business risk has become a critical success factor for board members and senior executives. High-profile losses and new regulations across many industry sectors make it crucial to monitor and manage these risks closely. Even the best cybersecurity tools and all the data they produce cannot predict the business impact of unexpected digital exposures lurking around the corner.

THE ONLY DYNAMIC DIGITAL RISK PLATFORM

The Instinct Engine implements a dynamic quantitative risk model to capture inputs from your key business and security stakeholders. It combines this expert information with targeted metrics and analytics to help organizations manage their cyber risk appetite at the second line of defense. The Instinct Engine provides consistent visibility into risk posture across business units, technologies, and assets—comparing the total impact an organization is willing to tolerate against tomorrow's scenarios, predicting where attacks may occur and the damage they

can cause.

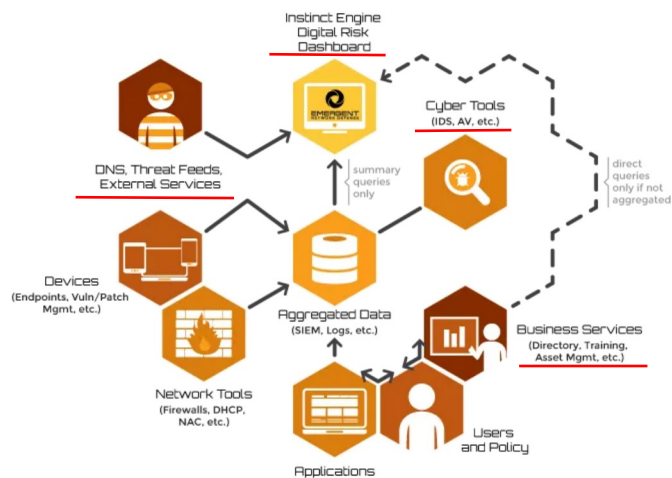

EASY TO DEPLOY, SELF-LEARNING, INSTINCTIVE INTERFACE

The Instinct Engine installs easily on-premises or in the cloud and only needs two to three data sources to begin providing a picture of your digital risks.

It takes a multidimensional compound-metric approach to answering the question "*should we be nervous?*" about risk exposures ranging from:

- Cyber Exposures
- Personnel Factors
- Process Breakdowns
- Technology Impact
- and more.

The engine assesses hundreds of potential loss scenarios created by these exposures and prioritizes those that are the most likely and could create the biggest business impacts.
