

Threat and Vulnerability Management (TVM) Software

Don't get distracted by the wrong vulnerabilities. Resolver's powerful software helps protect against cyber breaches by prioritizing on a risk-based approach to threat and vulnerability management.

REQUEST A DEMO

Focus on the right vulnerabilities. Be "Board Ready".

Many organizations are on the wrong end of an intrusion or data breach. Your board is likely reading a ton of press on this subject each week. While boards have great literacy on reading financials, they likely don't have much clarity into your information security practices.

The inevitable question is "Will that happen to us?" Be ready. By taking a risk-based approach to threats, you can focus on the vulnerabilities that have the biggest risk impact for your organization. Resolver's vulnerability management software can help you provide this education to your board and C-Suite using customized risk scoring algorithms and powerful dashboards to show your remediation efforts. We do all of this out-of-the-box.

Prioritize your efforts to reduce vulnerability

Fast, automated collection of data

Get your threat data integrated to Resolver. With 40+ connectors out-of-the-box, you can correlate millions of assets and 10x that number of vulnerabilities. [See full list of integrations.](#)

Gain greater risk intelligence

Correlate assets with business context and threat intelligence. Tie vulnerabilities to threat exploits and event analysis.

Risk scoring to prioritize vulnerabilities

Use multi-attribute risk scoring algorithms that are weighted based on business priorities, threat exploits and vulnerabilities. [Visualize your cyber risk posture.](#)

Ticketing and verification for quick response

Remediate quickly, prioritize and group vulnerabilities based on configurable criteria including criticality, compliance regulations, vendor SLAs or more. Close the loop by verifying that the actions taken were effective, based on the new risk scores.

You're in good company

Over 1000 of the world's largest organizations use Resolver software to protect their employees, customers, data, brand, inventory, and shareholders.

Frequently Asked Questions

We're here to answer any questions you may have.

How does Resolver help with Threat and Vulnerability Management?

With regards to vulnerability management, the RiskVision platform can allow you to perform the following:

1. Asset Classification: Classify your assets based on criticality to the business and tag assets for higher priority (e.g. contains PCI data, in DMZ, contains intellectual property)
2. Data Integration: Integrate your technologies (i.e. vulnerability scanners, SIEMs, CMDBs, threat feeds) with RiskVision to collect and correlate all vulnerability data in one centralized location.
3. Risk Scoring: Review your vulnerabilities with a multi-attribute risk score that provides business context beyond CVSS scores.
4. Risk Prioritization: Prioritize and automate your vulnerability remediation based on risk score, age, vulnerability count, SLA's – risk scores are configurable.
5. Ticketing: Auto-create or manually create remediation tickets to patch vulnerabilities or request exceptions for vulnerabilities that can't be patched right away, or at all.
6. Remediation Verification: Close the risk management loop by reviewing the risk scores of your vulnerabilities after they've been patched to make sure your efforts were effective.
7. Advanced Reporting: Constantly monitor your risks with visualized dashboards and share them across business units, geographies, etc.

With regards to threat management, the RiskVision platform can automatically import threat intelligence and correlate it with vulnerabilities when the threat intelligence provides CVE references.

Beyond vulnerability prioritization and importing threat intelligence, the team responsible for mitigating IT threats can assign remediation tickets required against a specific threat. The platform can also link to events and incidents to provide greater visibility into the impact of a specific threat in your environment.

Where does Resolver obtain its threat and exploit data from?

Are risk scoring formulas customizable?

What scanners do you have a pre-built connector for?

Does Resolver offer a ticketing system, or do I need to have one and connect to it?

Does Resolver offer an exception process (also known as a risk waiver process)?
